

What is claimed is:

1. A cap phone comprising:
a cap including a soft crown and a visor attached to the crown; and
a telephone supported by the cap such that a user can telecommunicate,
hands-free, while wearing the cap.
2. The cap phone of claim 1, wherein the crown includes a circumferential
edge and the telephone includes an earphone movably supported to
move between a retracted position above the circumferential edge and a
deployed position below the circumferential edge.
3. The cap phone of claim 2, wherein the earphone is pivotally supported to
move between said retracted and deployed positions.
4. The cap phone of claim 2, wherein the earphone is slidably supported to
be vertically-adjustable.
5. The cap phone of claim 1, wherein a substantial portion of the telephone
including a telephone battery holder is supported under the crown.

6. The cap phone of claim 1, wherein a telephone battery holder is positioned under the crown, the holder having a convex shape that conforms to an inner upper portion of the crown.
7. The cap phone of claim 1, wherein the visor includes a concave underside and the cap phone includes a movably supported microphone arm, the arm being movable to a deployed position and to a retracted position wherein most of the arm is within boundaries defined by the concave underside of the visor when in the retracted position.
8. The cap phone of claim 7, wherein the arm includes a proximal portion positioned adjacent the crown, the proximal portion being approximately L-shaped to enable the arm to get into said retracted position.
9. The cap phone of claim 1, wherein the visor is arch-shaped and the telephone includes an antenna supported by the visor, the antenna being arch-shaped thereby conforming to the visor.
10. The cap phone of claim 1, wherein the visor includes a rounded frontal edge and the telephone includes an antenna supported by the visor, the antenna being shaped and positioned to conform to the rounded frontal edge of the visor.

11. A cap phone comprising:

a cap including a crown and a visor attached to the crown, the visor having an underside; and
a telephone supported by the cap, the telephone having a keypad positioned on the visor underside.

12. The cap phone of claim 11, wherein said underside is concave and the keypad is supported on a convex housing shaped to conform to the concave visor underside.

13. The cap phone of claim 11, further comprising the telephone having a display screen supported on the visor underside.

14. The cap phone of claim 13, wherein said underside is concave and the display screen is supported on a convex housing shaped to conform to the concave visor underside.

15. A cap phone comprising:

a cap including a soft crown and a visor attached to the crown; and
a telephone combined with the cap such that a user can telecommunicate while wearing the cap, the telephone being at least partially supported by a stiff arcuate rib that forms an upstanding arch under the crown.

16. The cap phone of claim 15, wherein the telephone includes a microphone arm movably supported by the rib.

17. The cap phone of claim 16, wherein the visor includes a concave underside and the arm includes a proximal portion positioned adjacent the crown, the proximal portion being approximately L-shaped to enable the arm to get into a retracted position wherein most of the arm is within boundaries defined by said concave underside.

18. The cap phone of claim 15, further comprising a second stiff arcuate rib that forms an upstanding arch under the crown for additional support of the telephone, the second rib having an end portion fixedly connected to the visor wherein the ribs are transverse to each other.

19. The cap phone of claim 15, wherein a telephone battery holder is positioned under the crown, the holder being supported by the rib, the rib having an end portion rigidly connected to the visor.

20. The cap phone of claim 1, wherein a microphone is operatively positioned at the cap visor.
